

Ten LVCMOS Output Low Additive Jitter Fanout Buffer

Features

- 3 to 1 input Multiplexer: Two inputs accept any differential (LVPECL, HCSSL, LVDS, SSTL, CML, LVCMOS) or a single ended signal and the third input accepts a crystal or a single ended signal
- Ten 1.5V/1.8V/2.5V/3.3V LVCMOS outputs
- Supports frequencies from 0 to 200MHz
- Supports crystals from 8MHz to 60MHz
- Ultra-low additive jitter: 17fs (12kHz to 20MHz)
- Ultra-low noise floor of -170dBc/Hz
- Supports 2.5V or 3.3V power supplies
- Output to output skew of 30ps (typical)
- Input to output delay of 2ns (typical)

Functional Description

The ZL40241 is a pin controlled low additive jitter, low power 3 x 10 LVCMOS fanout buffer.

Two inputs can accept signal in differential (LVPECL, SSTL, LVDS, HSTL, CML) or single ended (LVPECL or LVCMOS) format and the third input can accept a single ended signal or it can be used to build a crystal oscillator by connecting an external crystal resonator between its XIN and XOUT pins. .

The ZL40241 has ten LVCMOS outputs which can be powered from 3.3V, 2.5V, 1.8V or 1.5V supply. Output can be synchronously enabled/disabled via OE pin.

The device operates from 2.5V+/-5% or 3.3V+/-5% supply. Its operation is guaranteed over the industrial temperature range -40°C to +85°C.

Clock Inputs

The following blocks diagram shows how to terminate different signals fed to the ZL40241 inputs.

Figure 3 shows how to terminate a single ended output such as LVCMOS. Ideally, resistors R1 and R2 should be 100Ω each so that the transmission line is terminated with matched impedance (50Ω). However, if the driving strength of the output driver is not sufficient resistor values should be increased

Clock Outputs

LVC MOS outputs require only series termination resistor whose value is depending on LVC MOS output voltage as shown in Figure 11.

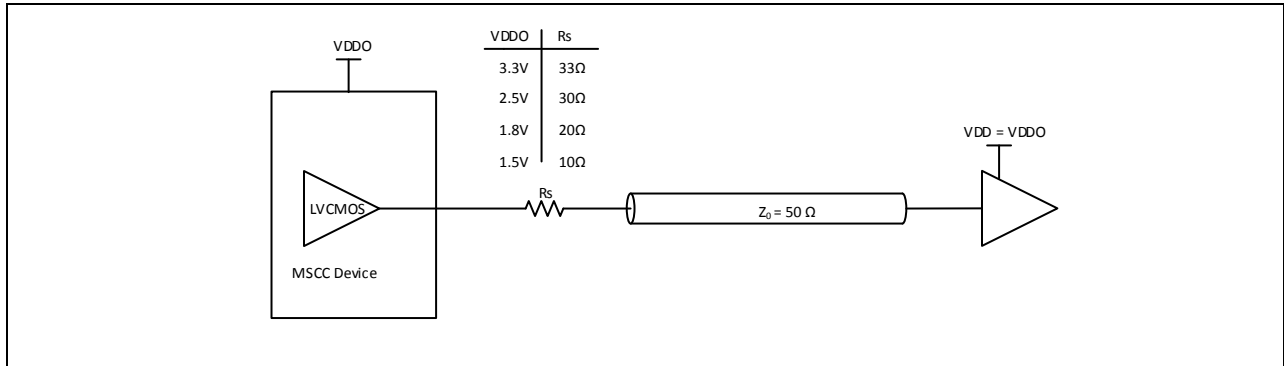

Figure 11. Termination for 3.3V LVPECL outputs

Crystal Oscillator Input

The crystal oscillator circuit can work with crystal resonators from 8MHz to 60MHz. Load capacitors C1 and C2 shall be selected as per crystal vendor recommendation. Shunt resistor is implemented inside the device.

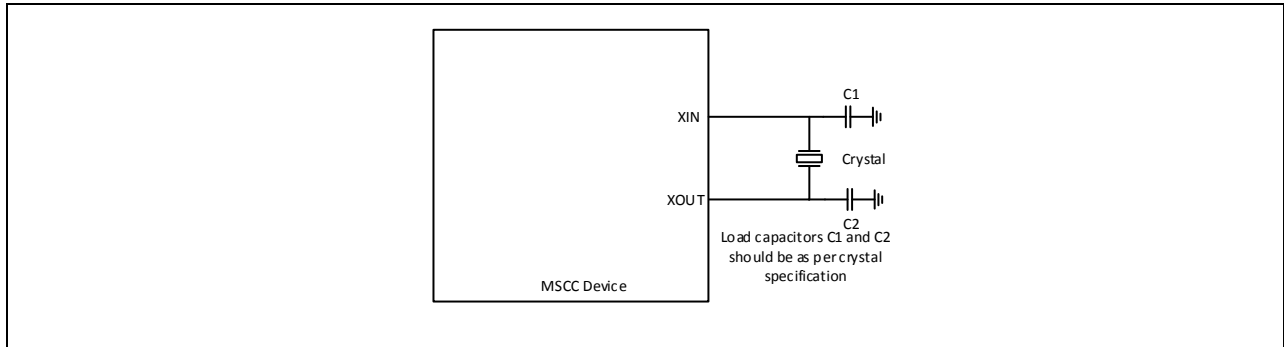

Figure 12. Crystal Oscillator Circuit

The phase noise plot for 25MHz crystal is shown in Figure 13. The phase noise floor of the device is below -170dBc/Hz as can be seen on the figure.

Figure 13. Phase Noise Plot with 25MHz Crystal

Termination of unused inputs and outputs

Unused inputs can be left unconnected or alternatively IN_0/1 can be pulled-down by 1kΩ resistor. Unused outputs should be left unconnected.

Power Consumption

The total device power consumption can be calculated as:

$$P_T = P_S + P_{XTAL} + P_C + P_D$$

Where:

$$P_S = V_{DD} \times I_S$$

is static power consumed by input buffers. If XTAL is running this power should be set to zero. where the static current (I_S) is specified in Table 4 .

$$P_{XTAL} = V_{DD} \times I_{DD_XTAL}$$

is power consumption of XTAL circuit. The current of the XTAL circuit is provided in Table 4 . If XTAL is not used the power consumption is equal to zero.

$$P_C = V_{DDO} \times I_{DDC}$$

Common output power shared among all ten outputs. The current (I_{DDC}) is specified in Table 4 . ,

$$P_D = V_{DDO} \times (I_{DD} \times n \times f / 100MHz + V_{DDO} \times C_{LOAD} \times f \times n)$$

Dynamic power where dynamic current (I_{DD}) is specified in Table 4 . , C_{LOAD} is capacitive load driven by an output, f is frequency of the output clock and n is number of active outputs.

The power consumption for different clock frequencies and power supply voltages can be quickly estimated from Figure 14, Figure 15 and Figure 15.

Figure 14. Device power consumption per output for $V_{DD} = V_{DDO} = 3.465V$

Figure 15. Device power consumption per output for $V_{DD} = V_{DDO} = 2.625V$

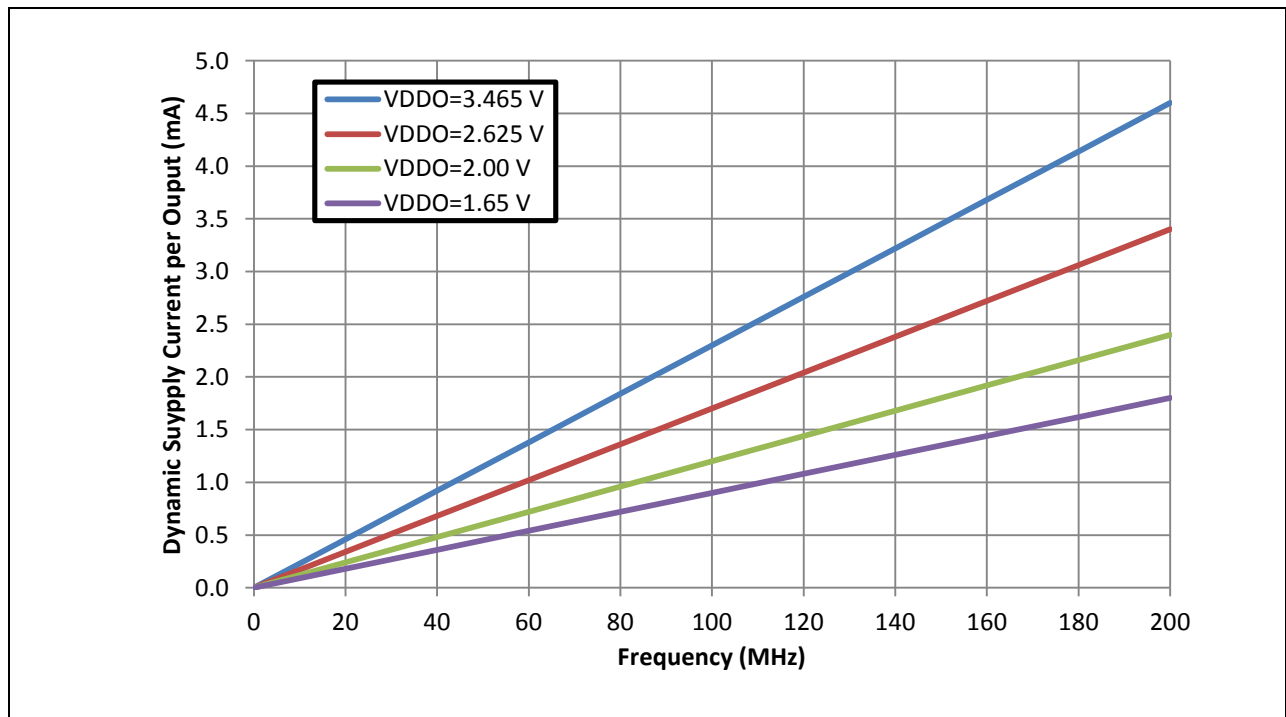

Figure 16. Dynamic supply current per output for different output supply voltages

Power Supply Filtering

Each power pin (VDD and VDDO) should be decoupled with 0.1 μ F capacitor with minimum equivalent series resistance (ESR) and minimum series inductance (ESL). For example 0402 X5R Ceramic Capacitors with 6.3V minimum rating could be used. These capacitors should be placed as close as possible to the power pins. To reduce the power noise from adjacent digital components on the board each power supply could be further insulated with low resistance ferrite bead with two capacitors. The ferrite bead will also insulate adjacent component from the noise generated from the device. Following figure shows recommended decoupling for each power pin.

Figure 17. Power Supply Filtering

Device Control

ZL40241 is controlled via Output Enable (OE) and Input Select (SEL0/1) input pins. Output is disabled synchronously on the falling edge of the input (t_2) as shown in Figure 18.

Figure 18. OE Output Disable

Outputs can be enabled by toggling OE pin high. As soon as OE pin goes high (t_1) the outputs will go from high-Z to low and will start to track the input after the first falling edge (t_2) of the input signal as shown in Figure 19.

- (1) Needs to be scaled for different frequencies by f/100MHz
- (2) To calculate total power consumption use following formula: $P = (I_s + I_{DD_XTAL}) * VDD + (I_{DDC} + I_{DD} * n * f/100MHz + VDDO * C_{LOAD} * f * n) * VDDO$, where I_{DD_XTAL} : should be set to zero if XTAL is not used or I_s should be set to zero if XTAL is used.
n: number of active outputs
f: frequency of the clock
 C_{LOAD} : is capacitive load driven by an output.
- (3) This current is consumed by device whenever one or more outputs are enabled. It is independent of the number of active outputs

* Values are over all two power supply modes (V_{DD} = 3.3V and V_{DD} = 2.5V)

(1) System level additive jitter is calculated as $J_{RMS_SYS_AJ} = J_{RMS_OUT} - J_{RMS_IN}$

(2) Additive jitter is calculated as $J_{RMS_AJ} = \sqrt{J_{RMS_OUT}^2 - J_{RMS_IN}^2}$ where jitter is integrated in 12 kHz to 20 MHz band

Tester measures jitter at 156.25MHz. Since this freq won't appear in the data sheet, it should be removed from the PPGT. Data sheet jitter is guaranteed by lab char. The ATE jitter measurement will be used to screen outliers only, with limits based on ATE distribution

* Xtal frequency is 25 MHz

Table 10 - 5x5mm QFN Package Thermal Properties

Parameter	Symbol	Conditions	Value	Units
Maximum Ambient Temperature	T _A		85	°C
Maximum Junction Temperature	T _{JMAX}		125	°C
Junction to Ambient Thermal Resistance ⁽¹⁾ (Note 1)	θ _{JA}	still air	26.8	°C/W
		1m/s airflow	21.8	
		2.5m/s airflow	19.9	
Junction to Board Thermal Resistance	θ _{JB}		10.8	°C/W
Junction to Case Thermal Resistance	θ _{JC}		19.5	°C/W
Junction to Pad Thermal Resistance ⁽²⁾	θ _{JP}	Still air	6.5	°C/W
Junction to Top-Center Thermal Characterization Parameter	ψ _{JT}	Still air	0.6	°C/W

(1) Theta-JA (θ_{JA}) is the thermal resistance from junction to ambient when the package is mounted on an 4-layer JEDEC standard test board and dissipating maximum power

(2) Theta-JP (θ_{JP}) is the thermal resistance from junction to the center exposed pad on the bottom of the package)

NOTES:

1. DIMENSIONING AND TOLERANCE IS IN CONFORMANCE TO ASME Y14.5-1994. ALL DIMENSIONS ARE IN MILLIMETERS * IN DEGREES.
2. DIMENSION OF LEAD WIDTH APPLIES TO METALLIZED TERMINAL AND IS MEASURED BETWEEN 0.15mm AND 0.30mm FROM THE TERMINAL TIP (BOTH ROWS). IF THE TERMINAL HAS OPTIONAL RADIUS ON THE END OF THE TERMINAL THE LEAD WIDTH DIMENSION SHOULD NOT BE MEASURED IN THAT RADIUS AREA.

Microsemi Corporation (Nasdaq: MSCC) offers a comprehensive portfolio of semiconductor and system solutions for aerospace & defense, communications, data center and industrial markets. Products include high-performance and radiation-hardened analog mixed-signal integrated circuits, FPGAs, SoCs and ASICs; power management products; timing and synchronization devices and precise time solutions, setting the world's standard for time; voice processing devices; RF solutions; discrete components; enterprise storage and communication solutions, security technologies and scalable anti-tamper products; Ethernet solutions; Power-over-Ethernet ICs and midspans; as well as custom design capabilities and services. Microsemi is headquartered in Aliso Viejo, California, and has approximately 4,800 employees globally. Learn more at www.microsemi.com.
